Office Action Summary

The following is a quotation of the first paragraph of 35 U.S.C. § 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification is objected to under 35 U.S.C. § 112, first paragraph, as failing to provide an adequate written description and failing to provide an enabling disclosure. Applicant's objective is described as improving edge enhancement in x-ray imaging by making $R1 > (D-7/200)$ and $R2 > .15$ meters. But these distances are open ended and may even be infinity. More significantly, they comprise distances normally employed in medical and industrial radiography. Note the $R1$ s listed on page 16 of the specification. How does applicant's invention differ from standard or typical procedures?

Claims 1-25 are rejected under 35 U.S.C. § 112, first paragraph, for the reasons set forth in the objection to the specification.

The following is a quotation of 35 U.S.C. § 103 which forms the basis for all obviousness rejections set forth in this Office action:

A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the

subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Subject matter developed by another person, which qualifies as prior art only under subsection (f) or (g) of section 102 of this title, shall not preclude patentability under this section where the subject matter and the claimed invention were, at the time the invention was made, owned by the same person or subject to an obligation of assignment to the same person.

Claims 1-25 are rejected under 35 U.S.C. § 103 as being unpatentable over Catlin (2650308). Catlin describes the phenomenon of magnification that occurs in x-ray imaging and further reveals that radiography may comprise any number of combinations of object to source distance and object to detector distance.
